ENVIRONMENTAL POLICY

Reducing the burden on the environment is important to us. At no stage in the manufacture of Rytons ventilators are CFC gases used or emitted into the atmosphere.

All Rytons ventilators are completely rot and corrosion proof and will outlast the structure into which they are built, making the need to replace and dispose of a failed ventilator virtually unnecessary.

Where possible product packaging is made of degradable, re-cycled cardboard and we always ensure we use the minimum packaging possible.

At head office, we have a library of individual Product Guides printed on demand to minimise wasted resources. We always refer customers to our technical website, which most prefer, as the information is instantly available. Wherever possible we email product literature, invoices, statement and proofs of delivery.

Our offices are provided with recycling bins for paper, glass, tins and plastic bottles, which we dispose of at a local recycling centre.

We run our offices as efficiently as possible with attention to wasted energy in heating and lighting.

All cleaning materials bought are CFC free and environmentally sound cleaning agents are strongly recommended.
