Environmental Policy

Reducing the burden on the environment is important to us. At no stage in the manufacture of Rytons ventilators are CFC gases used or emitted into the atmosphere.

All Rytons vacuum-formed products i.e. Rytons Periscope® Vertical Extension (PUFVVEXT) are manufactured from recycled materials.

All Rytons ventilators are completely rot and corrosion proof and will outlast the structure into which they are built, making the need to replace and dispose of a failed ventilator virtually unnecessary.

Surplus products and packaging can be re-cycled by customers should they wish using suitable facilities.

Where possible product packaging is made of degradable, re-cycled cardboard and we always ensure we use the minimum packaging possible.

At head office, we have a library of individual Product Guides printed on demand to minimise wasted resources. Wherever possible we email product literature and refer customers to our technical website, which most prefer, as the information is instantly available.

The majority of company vehicles are hybrid or fully electric to reduce the use of carbon fuels and vehicle emissions.

Most deliveries are made by [DPD](#) who are committed to making every parcel they deliver carbon net zero by 2040.

Our offices are provided with recycling bins for paper, glass, tins and plastic bottles, which we dispose of at a local recycling centre.

We run our offices as efficiently as possible with attention to wasted energy in heating and lighting.

All cleaning materials bought are CFC free and environmentally sound cleaning agents are strongly recommended.
